

Differential Equations quiz 1

Version 1

1.

A thermometer is removed from a room where the temperature is 70°F and is taken outside, where the air temperature is 10°F . After one-half minute the thermometer reads 50°F . What is the reading of the thermometer at $t = 1\text{ min}$? How long will it take for the thermometer to reach 15°F ?

2.

Two large containers A and B of the same size are filled with different fluids. The fluids in containers A and B are maintained at 0°C and 100°C , respectively. A small metal bar, whose initial temperature is 100°C , is lowered into container A . After 1 minute the temperature of the bar is 90°C . After 2 minutes the bar is removed and instantly transferred to the other container. After 1 minute in container B the temperature of the bar rises 10° . How long, measured from the start of the entire process, will it take the bar to reach 99.9°C ?

3.

Constant-Harvest Model A model that describes the population of a fishery in which harvesting takes place at a constant rate is given by

$$\frac{dP}{dt} = kP - h,$$

where k and h are positive constants.

(a) Solve the DE subject to $P(0) = P_0$.

(b) Describe the behavior of the population $P(t)$ for increasing time in the three cases $P_0 > h/k$, $P_0 = h/k$, and $0 < P_0 < h/k$.

(c) Use the results from part (b) to determine whether the fish population will ever go extinct in finite time, that is, whether there exists a time $T > 0$ such that $P(T) = 0$. If the population goes extinct, then find T .

4. Consider the initial value problem $y' = ty(4-y)/3, y(0) = y_0$. (a) Determine how the behavior of the solution as t increases depends on the initial value y_0 . (b) Suppose that $y_0 = 0.5$. Find the time T at which the solution first reaches the value 3.98

5. The value of y_0 for which the solution of the equation $y' - y = 1 + 3\sin(t)$, $y(0) = y_0$ remains finite as $t \rightarrow \infty$ is?

6. A population of species satisfies $y' = (0.5 + \sin(t))(y/5)$. If $y(0) = 1$. The time T at which the population has doubled is?

Version 2

1. Consider the set of solutions u_1 and u_2 which are a fundamental set of solutions for the differential equation $u'' + q(t)u' + p(t)u = 0$. Given that

$$u_3 = p_1 u_1 + p_2 u_2$$

$$u_4 = s_1 u_1 + s_2 u_2,$$

where s_1, s_2, p_1 , and p_2 are any constants. Show that $W[u_3, u_4] = (p_1 s_2 - p_2 s_1) W[u_1, u_2]$. Do u_3 and u_4 also form a fundamental set of solutions? Why or why not?

2. Let u_1 and u_2 be two solutions of a differential equation $y'' + p(t)y' + q(t)y = 0$. If both these solutions have a point of inflection at the same point, say at t_0 in an interval J , then show that they cannot be a fundamental set of solutions on J unless both $p(t)$ and $q(t)$ are zero at t_0 .

3. A model for the population $P(t)$ in a suburb of a large city is given by the initial-value problem

$$dP/dt = P(0.1 - (10^{-7})P), \quad P(0) = 5000$$

where t is measured in months. What is the limiting value of the population? At what time will the population be equal to one-half of this limiting value?
