solutions to Quiz-2 (Group-B) IEC102 The switch drawn in Fig. (1) has been open a ponderously long line (i.e., the circuit is in steady state before the switch is closed).

a) Determine the value of ownerst labelled 'i' pros to the switch being closed,

b) obtain the value of (i) just after the switch is closed.

e) Find the expression for Vc(t) for time t>0

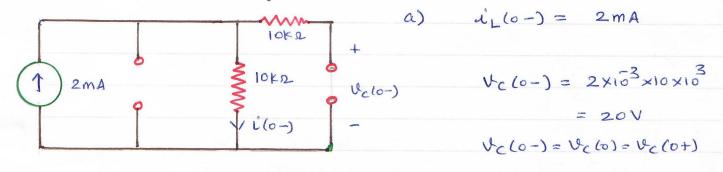

PTO

c) Find the expression for U(t) for any time t>0.

Sol.

Circuit at t=0- (just before the switch is closed).

The capacitor acts as open circuit the cuscuit is in steady state at t=o-(given).

Cigable at t = 0 (switch is closed) and t > 0 loka loka

b) $L'(0+) = 0 \quad \text{as there is a short cisaut in parallel with}$ this resister as the smitch is closed.

c)
$$V_c(t) = V_c(0) e$$

where $V_{C}(0) = 20V$ $T = Req C = 10 K \times 150 \times 10^{9} = 10 \times 10^{3} \times 150 \times 10^{9}$ $= 15 \times 10^{-4}$ = 1.5 ms $\therefore V_{C}(1) = 20 e^{\frac{1}{1.5} \times 10^{3}} = 20 e^{\frac{1}{15}}$

$$V_{C(t)} = 20 e^{\frac{-2000t}{3}} V \qquad for t > 0$$

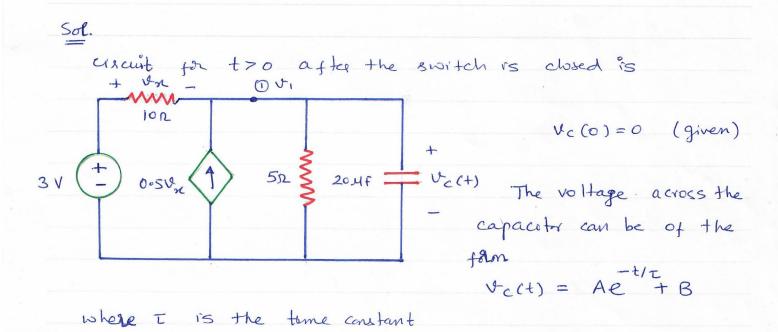

For the circuit shown in Fig. 62, find $v_c(t)$ for all t > 0. Given that the capacitor is initially uncharged ie., $v_c(0) = 0$.

The second initially $v_c(0) = 0$.

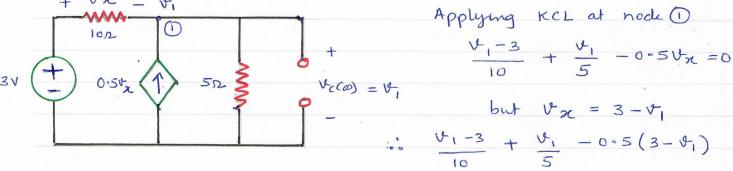

0.5V

Fig. Q2

V, (+) =

 $\frac{V_{c}(o)}{at + \infty}$ at the circuit well be in steady state and capacitor acts as a open circuit.

Free Lineal Graph Parier from http://www.nestoch.com/graphpaner/lineal

$$\frac{7}{10} + \frac{4}{5} = 0.5 (3-4) = 0$$

$$V_{c}(t) = Ae^{-t/\tau} + B$$

$$V_{c}(\infty) = 0 + B = \frac{9}{4} \Rightarrow B = \frac{9}{4}$$

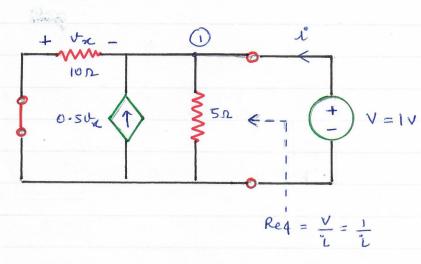

$$v_{c}(0) = A + B = 0$$

$$\Rightarrow A = -B = -\frac{9}{4} \Rightarrow A = -\frac{9}{4}$$

$$v_{c}(t) = -\frac{9}{4}e^{-t/\tau} + \frac{9}{4} = \frac{9}{4}(1 - e^{t/\tau})$$

To find I, we have open the capacitor and find the equivalent gresstance of the gremaining ascist by turning off all independent sources.

Req

Since there is dependent
source connect a known
Voltage source of say IV
and find the current 'i'
pumped by the source

$$Req = \frac{V}{i} = \frac{1}{i}$$

Applying KCL at node 1 $\frac{V_1}{10} + \frac{V_1}{5} + \frac{-0.5 V_{\infty}}{10} = 0$

$$\frac{y_1}{10} + \frac{y_1}{5} + 0.50, -1 = 0$$

$$\Rightarrow V_1 + 2V_1 + 5V_1 = 10i$$

$$\Rightarrow 10i = 8V_1$$

$$5w V_1 = V = 1V$$

$$T = Req C = \frac{1}{0.8} \times 20 \times 10^{-6} = \frac{200}{8} \times 10^{-6}$$

Find i(t) for +>0. Assume that the curcuit is in stendy state at t=0rict) X +=0 IOV 102 0.01F Fig. 33 Sol. The circuit at t=0- (since it is in steady state, the capacities acts as an open circuit and inductor acts as a short circuit) 10(0-) $i(0-) = \frac{10}{10} = 1A = i(0) = i(0+)$ Vc(0-) (since i is the current through inductor) V-(10-) = 0 = V-(10) = V-(10+) CK+ at t=0 (The switch is closed) 20V Using source transformation VC ⇒ 3A (2H 3 102 } 102 \$ 2A (0.01F

It is a forced parallel RZC circuit

The ascust is parallel RLC circuit with a source.

$$\alpha = \frac{1}{2RC} = \frac{1}{2 \times 5 \times 0.01} = \frac{1}{0.1} = \frac{1}{10 \text{ rad/s}}$$

$$Wo = \frac{1}{\sqrt{LC}} = \frac{1}{\sqrt{2 \times 0.01}} = \frac{10}{\sqrt{2}} \text{ rad /s}$$

 $2 > W_0$,... The circuit is overdamped $S_1, S_2 = -2 \mp \sqrt{2^2 - W_0^2} = -10 \mp \sqrt{50} = -17.07, -2.93$ The response can be of the form

$$i(t) = K + A_1 e^{S_1 t} + A_2 e^{S_2 t}$$

= $K + A_1 e^{-17.07 t} + A_2 e^{-2.93 t}$

$$i(0-) = i(0) = i(0+) = 1A$$

$$V_{c}(0-) = 0 = V_{c}(0) = V_{c}(0+)$$

$$Ldi = V_{c}$$

$$=) Ldi(0) = V_{c}(0)$$

$$=) di(0) = V_{c}(0) = 0$$

$$= 0$$

$$\frac{di(4)}{dt} = 0 - 17.07 A_{1}e^{-17.07t} - 2.93 A_{2}e^{-2.93t}$$

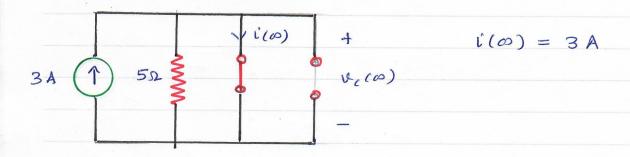

$$= -17.07 A_{1}e^{-17.07t} - 2.93 A_{2}e^{-2.93t}$$

$$\frac{dv(0)}{dt} = 0 = -17.07A_1 - 2.93A_2 = 0 ... (B)$$

We have 3 unknowns and 2 eqns.

The circuit well be in steady state at t = 00 (copacitor acts as open circuit and inductor acts as short circuit)

The curait at t = as

$$i(t) = K + A_1 e + A_2 e$$

$$i(\omega) = \left[K = 3\right] - \cdot (c)$$

Substitute Value of K in (A)

$$K + A_1 + A_2 = 1 \cdot \cdot \cdot \cdot \cdot (A)$$

=) $A_1 + A_2 = 1 - 3 = -2 \cdot \cdot \cdot \cdot \cdot (A)$

(B)

 $-17 \cdot 07 A_1 - 2 \cdot 93 A_2 = 0 \cdot \cdot \cdot \cdot (B)$

3 dving (A) and (B)
$$A_{1} = 0.4144$$
and $A_{2} = -2.4144$

$$-17.07t$$
 $-2.93t$... $l'(t) = 3 + 0.4144e$ $-2.4144e$
