POPL Monsoon 2018 Final Exam

POPL Instructors 2018-11-19 Mon

1 IF+/ language (60 points)

Refer to the IF+/ language specified at the end of this question paper.

1.1 Type safety (15 points)

State the type safety theorems (preservation and progress) for the the IF+/ language.

1,2 Language extension (45 points)

Extend the IF+/ language with a < (denoting the less than operator on numbers) construct. Show how the following get extended: semantic domains, syntax, rewrite rules, reduction rules, argument type mismatch judgements and the type system.

Determinacy (60 points)

State and prove that the reduction rules of IF+/ form a deterministic transition system: i.e., for any expression e, e reduces to atmost one expression. [Hint: show $e \to e'$ and $e \to e''$ implies e' = e''.] State clearly the induction scheme employed. Also, clearly state the reason for each step in the proof. To save time, you may restrict your proof to rules that deal only with the numbers, addition, and the if construct in the syntax.

3 CPS Transformations (30 points)

Transform the following direct style programs into continuation passing style.

3.1 Hemachandra-Fibonacci function

3.2 Reduce

(define (reduce) x0 f us) (if (null? us) x0.
(f (reduce x0 f (rest us))
(first us),))) AST evaluation (30 points)

Assume the top-level continuation is the identity function. Assume, further, that +, sub1 and * are part of the language's syntax, i.e., keywords. Assume that the top-level environment contains closures corresponding to the following two functions:

(define (f n) - ~-(+ 4 (g (sub1 n)))) (define (g m) (* m 5)).

Draw an AST annotation diagram illustrating the evaluation of the expresion below, assuming the evaluation is done in continuation passing style:

(+ 3 (f 2)) (+ 3 (f 2)) Recap of the IF+/ language

Semantic domains and Syntax

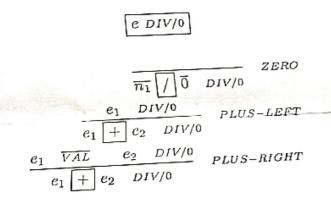

·	VAL	Value		$\epsilon \in EXP$
